Trimble R12i

GNSS SYSTEM

KEY FEATURES

- Trimble® Inertial Platform™ (TIP™) technology. Calibration-free and magnetically immune IMU-based tilt compensation for topo measurements and stakeout.
- ► Trimble ProPoint® GNSS positioning engine. Engineered for improved accuracy and productivity in challenging GNSS conditions.
- ► 672-channel solution with Trimble 360 satellite tracking technology
- Trimble CenterPoint® RTX correction service delivers fast, RTK-level accuracy worldwide via satellite/IP
- ► Trimble xFill® correction outage technology
- ► Trimble IonoGuard™ technology for mitigation of ionospheric GNSS signal disruptions
- ▶ Optimised for Trimble Access™ field software
- ▶ Android™ and iOS platform support
- ► Cellular, Bluetooth®, Wi-Fi® data connectivity
- Military-spec rugged design and IP-67 rating
- Ergonomic form factor
- All day battery with built-in status indicator
- ► 6 GB internal memory

PERFORMANCE SPECIFICATIONS

GNSS MEASUREMENTS

Constellation agnostic, flexible signal tracking, improved positioning in challenging environments1 and inertial measurement integration with Trimble ProPoint GNSS technology.

Increased measurement and stakeout productivity and traceability with Trimble TIP technology IMU-based

Advanced Trimble Custom Survey GNSS chips with 672 channels

Trimble CenterPoint RTX correction service is activated and ready to use for the initial 12 months.

Learn more at rtx.trimble.com

Reduced downtime due to loss of radio signal or cellular connectivity with Trimble xFill technology

Trimble IonoGuard technology for mitigation of ionospheric GNSS signal disruptions

Signals tracked simultaneously GPS: L1C, L1C/A, L2C, L2E, L5 GLONASS: L1C/A, L1P, L2C/A, L2P, L3

SBAS (WAAS, EGNOS, GAGAN, MSAS): L1C/A, L5 Galileo: E1, E5A, E5B, E5 AltBOC, E62 BeiDou: B1, B1C, B2, B2A, B2B, B3 QZSS: L1C/A, L1S, L1C, L2C, L5, L6 NavIC (IRNSS): L5

L-band: Trimble RTX® Corrections

 $Iridium\ filtering\ above\ 1616\ MHz\ allows\ antenna\ to\ be\ used\ up\ to\ 20\ m\ away\ from\ iridium\ transmitter$

Japanese LTE filtering below 1510 MHz allows antenna to be used up to 100 m away from Japanese LTE cell tower

Digital Signal Processor (DSP) techniques to detect and recover from spoofed GNSS signals

Advanced Receiver Autonomous Integrity Monitoring (RAIM) algorithm to detect and reject problem satellite measurements to improve position quality

Improved protection from erroneous ephemeris data

Positioning Rates 1 Hz, 2 Hz, 5 Hz, 10 Hz, and 20 Hz

Trimble R12i GNSS SYSTEM

- Challenging GNSS environments are locations where the receiver has sufficient satellite availability to achieve minimum accuracy requirements, but where the signal may be partly obstructed by and/or reflected off of trees, buildings, and other objects. Actual results may vary based on user's geographic location and

- Challenging GNSS environments are locations where the receiver has sufficient satellite availability to achieve minimum accuracy requirements, but where the signal may be partly obstructed by and/or reflected off of trees, buildings, and other objects. Actual results may vary based on user's geographic location and atmospheric activity, scintillation levels, GNSS constellation health and availability, and level of multipath and signal occlusion.
 The current capability in the receivers is based on publicly available information. As such, Trimble cannot guarantee that these receivers will be fully compatible with a future generation of Galileo satellites or signals.
 Precision and reliability may be subject to anomalies due to multipath, obstructions, satellite geometry, and atmospheric conditions. The specifications stated recommend the use of stable mounts in an open sky view, EMI and multipath clean environment, optimal GNSS constellation configurations, along with the use of survey practices that are generally accepted for performing the highest-order surveys for the applicable application including occupation times appropriate for baseline length. Baselines longer than 30 km require precise ephemeris and occupations up to 24 hours may be required to achieve the high precision static specification.
 Network RTK PPM values are referenced to the closest physical base station.
 May be affected by atmospheric conditions, signal multipath, obstructions and satellite geometry. Initialisation reliability is continuously monitored to ensure highest quality.
 TiP references the overall positioning error estimate at the tip of the surveying pole throughout the tilt compensation range. RTK refers to the estimated horizontal precision of the underlying GNSS position, which is dependent on factors that affect GNSS solution quality. The 3 mm constant error component accounts for residual misalignment between the vertical axes of the receiver and the
